# Harmfully Manipulated Images Matter in Multimodal Misinformation Detection

Bing Wang, Shengsheng Wang\*, Changchun Li, Renchu Guan, Ximing Li\*

### Motivation

Manipulation is a crucial feature in multimodal misinformation detection

As surveys, a majority of fake articles may contain **manipulated images** created by various techniques.

# Not all manipulated information is misinformation

The images of fake articles are more likely with harmful intentions, e.g., deception, but the ones of real articles are with harmless intentions, e.g., watermarking.

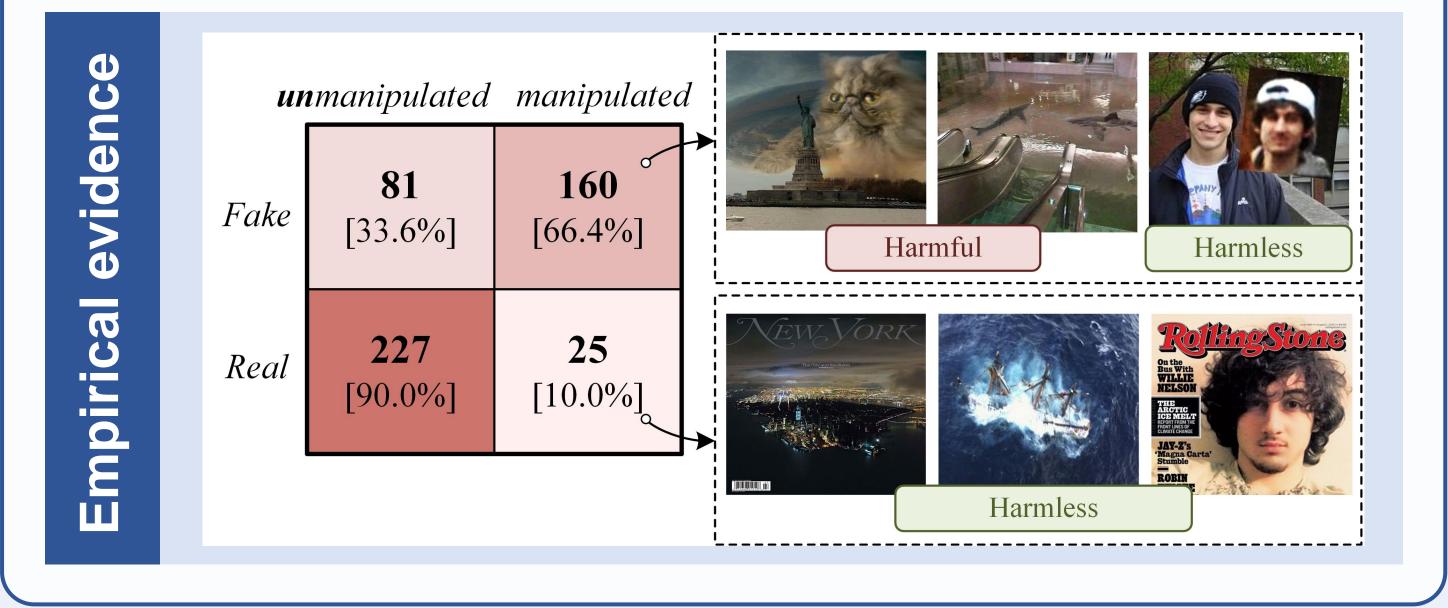

# **Module 3: Predictors Module**

This module contains three predictors trained on three different tasks:

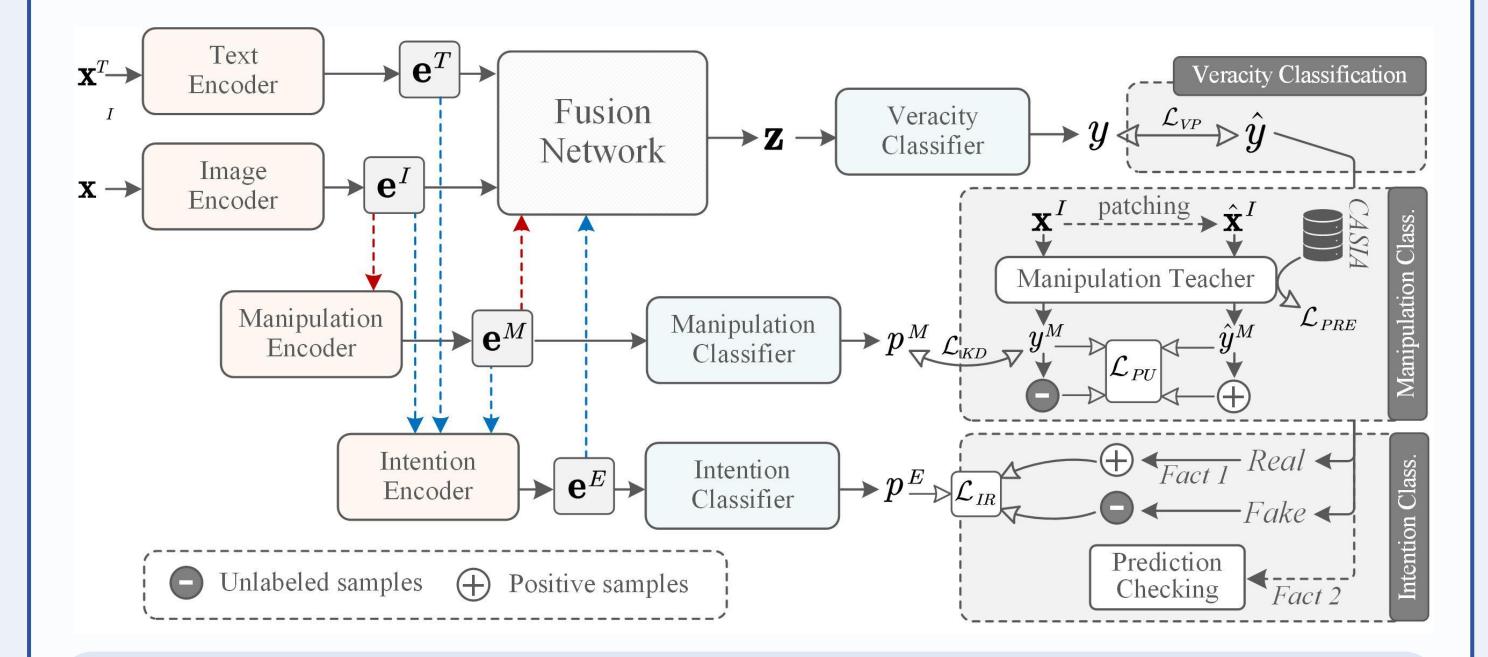

# **Task A: Veracity Classification**

Utilizing the fused feature, a linear veracity classifier is employed to predict the veracity label.

## **Task B: Manipulation Classification**

#### Our Method: HAMI-M3D

- Knowledge distillation: Training a manipulation teacher and then distilling its predictions to the manipulation classifier.
- Pre-training: Pre-training the manipulation teacher with a benchmark dataset on image manipulation detection, e.g., CASIAv2.
- Positive and Unlabeled (PU) learning: Given an image, we generate its manipulated version, and it is naturally assigned as "manipulated", the other is "unlabeled".

# **Task C: Intention Classification with PU learning**

- If the image of the real article is manipulated, its intention must be harmless; But if the image of the fake article is manipulated, its intention may be harmful or harmless.
- If the image of one article is manipulated by a harmful intention, the veracity label of this article must be fake; But if the image of one article is manipulated by a harmless intention, its veracity label may be real or fake.

We propose to detect misinformation by extracting distinctive **manipulation features** that reveal whether the image is manipulated, as well as **intent features** that differentiate between harmful and harmless intentions behind the manipulation.

#### **Module 1: Feature Encoders Module**

This module consists of four specific feature encoders, including text encoder, image encoder, manipulation encoder, and intention encoder.

### **Module 2: Feature Fusion Module**

Given these extracted features, the feature fusion module utilizes a multi-head attention network to integrate them into one fused feature.

#### **Experimental Results**

#### HAMI-M3D outperform 5 baselines across 3 datasets

# Key Takeaways

- Findings: We introduce image manipulation features into multimodal misinformation detection, and find that only the article that has been manipulated by <u>harmful intention</u> is misinformation.
- Method: We primarily propose three tasks: veracity classification, manipulation classification, and intention classification, which respectively detect whether an article is <u>misinformation</u>, whether its image has been manipulated, and whether this manipulation is harmful.
- > Experiments: By comparing with baseline models, we have demonstrated the effectiveness of our model.
